The process is useful for identifying new peptide ligands that protect the display system e.g. phage, which delivers drugs and genes in vivo. The delivery system may be inhibited through binding to complement, the process reveals peptides which may be used to protect the system from this inhibition. The present sequence represents a nuclear localisation signal
                                                                                                                                                                    Sequence
                                                                                                                                                                                               peptide, used in examples illustrating the invention.
                                                                                                                                                                                                                                                                                                                                                  Identifying new peptide ligands that protect phage which delivers drugs and genes in vivo, by binding to blood proteins, comprises exposing an epitope display system to blood products -

The covalent attachement does not involve biotinylated DNA, and does not prevent expression of the gene. The method is useful for enhancing gene delivery to a cell via the gene of the cell's internal localisation mechanisms, and does not the cell of the cell's internal localisation mechanisms.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a method of enhancing gene delivery to a cell for expression. The method comprises covalently attaching a cellular transport signal such as a nuclear localisation signal (NLS) to the nucleic acid to direct the nucleic acid to a target location. The signal sequence is not directly attached to the DNA; instead, it is attached to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Disclosure; Column 7;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Enhancing gene delivery to a cell for expression comprises covalently attaching a cellular transport-enhancing signal to the nucleic acid through an alkylating molecule, e.g. cyclopropapyrroloindole -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sebestyen MG,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           with prior art methods which rely on non-covalent complex formation between the DNA and the targetting moiety. Sequences AAB30981-B20987 are nuclear localisation signals which may be used in the method of the invention. These sequences all contain an N-terminal cysteine residue to facilitate attachment to the alkylating agent. The present sequence is an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  (MIRU-) MIRUS

Methods of days delivery expression product by delivering a polynucleotide in vitro or in vivo, comprises forming a complex by associating an amphiphile binding agent (ABA), an amphiphile and a polynucleotide, delivering the complex to a cell and expressing the polynucleotide. The method is useful for delivering polyners, nucleic acids, drugs and genes to cells. The delivering polynucleotides or genetic material produce a change in the cell that can be therapeutic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence representing long nuclear localising signal (NLS) peptide #2 of SV40 T-antigen is 1 of several peptides (AAU03179-AAU03187)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           complex with amphiphile binding agent, delivering the complex to the cell and
                                      The present invention relates to a method for delivery of modified nucleic acids to a cell. The method may be used for gene delivery and gene therapy. Polynucleotides are modified to contain specific signals enhance e.g. cellular uptake, cytoplasmic transport, nuclear localisation, gene expression, or chromosomal integration. The present sequence is a nuclear localisation signal which was used in the present
                                                                                                                                                                                                                            Wolff

The peptides can be conjugated to a lytic peptide to form a nucleic acid transporter system. The lysis agent forms an alpha-helical structure. The transporter system is used to deliver nucleic acid to a cell and for treating humans by gene therapy. By taking advantage of the characteristics of both the lysis agents and the binding molecules, delivery of the nucleic acid is enhanced. Specific lysis agents are capable of releasing the nucleic acid into the cellular interior from the endosome. Release is efficient without endosomal/lysosomal degradation. Once released the binding complexes help target the nucleic acid to the nucleus.

                                                                                                                                                                                                                                                                                                                                                                                                                 Matches
                                                                                                                                                                                                                                                                                                                                                                                         Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                    This invention relates to a process comprising exposing an epitope display system to blood products to identify useful epitopes. The process is useful for identifying new peptide ligands that protect the display system e.g. phage, which delivers drugs and genes in vivo. The delivery system may be inhibited through binding to complement, the process reveals peptides which may be used to protect the system from this inhibition. The present sequence represents a nuclear localisation signal peptide, used in examples illustrating the invention.
                                                                                                                               Nuclear localisation covalent attachment; large T antigen.

The peptides can be conjugated to a lytic peptide to form a nucleic acid transporter system. The lysis agent forms an alpha-helical structure. The transporter system is used to deliver nucleic acid to a cell and for treating humans by gene therapy. By taking advantage of the characteristics of both the lysis agents and the binding molecules, delivery of the nucleic acid is enhanced. Specific lysis agents are capable of releasing the nucleic acid into the cellular interior from the endosome. Release is efficient without endosomal/lysosomal degradation. Once released the binding complexes help target the nucleic acid to the nucleus.
The present sequence represents a nuclear location signal (NLS) peptide. The present invention describes a phage (such as a lambda-phage) having a NLS peptide fused to the phage head region protein (e.g. gpp protein). This enables the phage to locate itself more efficiently at the nucleus of an infected cell. The phage obtained can package lambda-phage DNA of 80% or 100% genomic size. Also described is DNA coding for the fused NLS/phage head region protein; vectors containing this DNA; cells (such as Escherichia coll) transformed by these vectors, and kits for production of phage incorporating the NLS, which include these transformed cells. The phage bearing the NLS protein fused to the phage head region efficiently transports phage DNA to the cell nucleus (e.g. in mammalian cells). It is therefore useful for insertion of foreign genes into the cell nucleus for gene therapy and for research purposes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        SX
                                                       The present invention describes a method for producing micelles with CC entrapped therapeutic agents. The method comprises: (1) combining consistively charged agent with a cationic lipid in a ratio where 30-90 % cC of the negatively charged atoms are neutralised by positive charges on CC lipid molecules to form an electrostatic micelle complex in 20-80 % cc thanol; and (2) combining the micelle complex of (a) with fusogenic-cx axyophilic peptide conjugates in a 0.0-0.3 ratio, therefore producing cmicelles with entrapped therapeutic agents. Also described is a method cc for delivering a therapeutic agent in vivo, comprising the administration of the micelle. ABB74256 to ABB74858 represent specifically claimed conclear localisation signal (NLS) peptides for use in the method as the CC diseases. The invention relates to the field of gene therapy and is CC diseases. The invention relates to the field of gene therapy and is CC diseases. The invention relates to the field of gene therapy and is CC diseases suitable for delivery of polymocleotides. The encapsulated complexes suitable for delivery of polymocleotides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      designed to bind to a target cell surface receptor to penetrate into target cells and to deliver a diagnostic probe or cytotoxic functionality to a desired site of action.

The conjugate may be described as a series of peptide and chemical domains which may be separated by junctions. Each domain performs a particular cell trargetting or a cellular function. Junctional segments are spacer regions that may in some cases allow the incorporation of chemically active moieties or markers. These domains and junctions are assembled on a branched polymer (BP) scaffold. The branching of the peptide is preferrably provided by a polylysine construct having free alpha and epsilon amino groups to which linear series of domains and junctions can be attached. A preferred number of branches for the BP unit is 8, such structures being referred to as octopeptides.

The conjugate is a relatively small molecule of flexible design having a branched structure for systematically incorporating a desired charge of cyrotoxic functions, peptide-based localisation signals or diagnostic probes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

                                                                                                                                                                                                                                                the nucleus of eukaryotic cells, comprising applying an electrical pulse of field strength 2-10 kV/cm; duration at least 10 micro s and current at least 1 Amp. The transfected cells are used for diagnosis and for gene therapy, after ex vivo preparation. The method delivers DNA and/or other biological agents to the nucleus of cells of higher eukaryotes, regardless of whether they are resting or dividing, and with very low comortality. The time between transfection and analysis can be reduced to as little as 2 hours and pulse parameters are optimised for maximum cc as little as 2 hours and pulse parameters are optimised for maximum cc nuclear localisation. The high voltage gradient creates pores in both cc irreversible damage. The present sequence is that of a peptide nucleic acid (PNA) comprising a nucleotide sequence is that of a peptide cc sequence given in the current record. The PNA, on successful transfection of the target cell, provides a repressor for a reporter compliance and the reporter gene cassette and inhibiting gene expression. While the comprises a sequence specific for reporter gene repression, while

A branched synthetic peptide conjugate is provided which can be designed to bind to a target cell surface receptor to penetrate into target cells and to deliver a diagnostic probe or cytotoxic functionality to a desired site of action.

The conjugate may be described as a series of peptide and chemical domains which may be separated by junctions. Each domain performs a particular cell targetting or a cellular function. Junctional segments particular regions that may in some cases allow the incorporation of chemically active moieties or markers. These domains and junctions are assembled on a branched polymer (BP) scaffold. The branching of the peptide is preferably provided by a polylysine construct having free alpha and epsilon amino groups to which linear series of domains and junctions can be attached. A preferred number of branches for the BP
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  CTS; domain; junction; octopeptide.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ঠ
                                                                                                                delivery vehicle comprises a nucleic acid uptake and release fusion comprises a nucleic acid uptake and release fusion protein, itself comprising an influenza virus haemagglutinin (HA) cendosomolytic peptide covalently attached via an amide linkage to a receptor ligand protein such as adenovirus penton base protein, epidermal creceptor ligand protein as adenovirus penton base protein, epidermal protein may additionally be joined to peptides which provide additional protein may additionally be joined to peptides which provide additional celes of nucleic acid attachment, and may also be joined to a nuclear cocalisation signal (NLS). The invention also encompasses a DNA construct encoding the nucleic acid uptake and release protein of the invention. The nucleic acid delivery vehicle is used for the intracellular delivery of specific nucleic acid sequences, for gene therapy of cancer, genetic diseases and viral infections. The present sequence represents the SV40 large T antigen NLS which was incorporated into certain nucleic acid uptake/release proteins of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        RESULT 26
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            밁
                                                                                                                                                                                                                                                                                                 This invention describes a novel nuclear transport system (I) which comprises (i) a module (A) that binds specifically to DNA and can not form a complex with more than one DNA molecule; and (ii) a module (B) chat includes a nuclear localization signal (NLS) or a non-NLS signal chart does not bind non-specifically to DNA. (I) is used to deliver nucleic acid to cells, especially for gene therapy of cancer, viral infections, diseases of the nervous system, transplant rejection and mono- or poly-genic inherited disorders. (I) provide efficient transfer of DNA to resting cells or cells with very low mitotic activity, i.e. primary cells, so eliminate the need to induce cell division for transfer, but can also be used with established cell lines. (I) does not transfer, but can also be used with established cell lines. (I) does not transport machinery, both features which improve transfer efficiency. It can be formulated as part of a virus-free gene transfer vehicle that is easy and inexpensive to prepare and easier to manipulate than known viral systems (and lacks the inherent risks of viral systems). This sequence crepresents the SV21 peptide described in the method of the invention.
                                                                                                                                                  Best
                                                                                                                           Matches
                                                                                                                                                                                      Query Match
                                                                                                                                                                                                                                                   Sequence

These domains and junctions are assembled on a branched polymer (BP) scaffold. The branching of the peptide is preferably provided by a polylyshe construct having free alpha and epsilon amino groups to which linear series of domains and junctions can be attached. A preferred number of branches for the BP unit is 8, such structures being referred to as octopeptides. The conjugate is a relatively small molecule of flexible design having a branched structure for systematically incorporating a desired number of cytotoxic functions, peptide-based localisation signals or desired as a relatively small molecule of flexible design having a branched structure for systematically incorporating a desired having the property of cytotoxic functions, peptide-based localisation signals or desired desired as a second control of the property of cytotoxic functions, peptide-based localisation signals or desired desired the property of t
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         gene therapy; neurological disorder; amnesia; Alzheimer's disease; Parkinson's disease; Huntington's disease; Pick's disease; retardation; amyotrophic lateral sclerosis; cerebral senility; learning disability; chronic peripheral neuropathy; Down's syndrome; duillain-Barre syndrome; Turret's syndrome; dyslexia; electric shock-induced amnesia; hippocampus; memory deficiency; mental illness; dementia; forebrain gene expression;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence represents a specific conjugate designated Octopeptide 4 of formula (NLS-CTS-Gly-Gly)8-BP-Tyr-Gly-bAla, or Octopeptide 5 of formula (Acr-NLS-CTS-Gly-Gly)8-BP-Tyr-Gly-bAla.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Calcium-calmodulin dependent kinase II alpha; gene therapy; neurological disorder; amnesia;
                                                                                                                              This sequence represents the SV40 nuclear localisation signal sequence. The invention relates to a recombinant nucleic acid (I), that comprises region of a calcium-calmodulin dependent kinase II alpha (CaMKII alpha) promoter (A), linked to a gene (II) of interest. (I) are used in gene therapy to treat neurological disorders, specifically; amnesia;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          WPI; 1999-337692/28

These conditions may also be treated using agents selected for their effect on human cells or transgenic animals containing (I). These agents can also be used, when labelled, as detection or quantitation reagents. (A) directs gene expression specifically in the forebrain, particularly the hippocampus.
                                      The present invention describes a nucleic acid uptake and release vehicle (UTARVE) comprising a fused ligand and endosmolytic peptide for the intracellular delivery of nucleic acid or oligonucleotides or modified analogues. The UTARVE can be used for intracellular delivery of gene sequences or oligonucleotides especially for gene therapy. Disease or disorder treated is dependent on the nucleic acid attached to the UTARVE, especially mentioned are the use of UTARVE-nucleic acid complexes as anti-viral or anti-cancer agents or for the treatment of genetic diseases e.g. diabetes, cystic fibrosis, haemophilia or adenosine deaminase defiency. The present sequence represents a

                                                                                                              The invention relates to a peptide comprising Tat sequence linked to nucleic acid-binding group. Peptides of the invention are used as components of a cell transfection system particularly for gene therapy (especially of cancer). The present sequence is nuclear localisation signal (NLS) phosphorylation site peptide from simian virus 40 (SV40) used for transfection enhancement. This sequence is used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  agricultural purposes. The complex is capable of transporting the macromolecule in a stable and condensed state and releasing the molecule into the cellular interior. The complex can bind with a cell surface receptor, lyse an endosome and target the nucleus of the cell.
                                                                                   Sequence
                                                                                                       exemplification of the invention.
                                                                                                                                                                                                                         New peptide comprising Tat sequence linked to nucleic acid-binding group, useful, e.g. in gene therapy, for improving cell-transfection

     3333333
The conjugate may be described as a series of peptide and chemical domains which may be separated by junctions. Each domain performs a particular cell targetting or a cellular function. Junctional segments
                                                                          A branched synthetic peptide conjugate is provided which designed to bind to a target cell surface receptor to per target cells and to deliver a diagnostic probe or cytotox functionality to a desired site of action.
                                                                                                                                                                                                        Disclosure; Pages 12,

The NLS replaces a fragment encoding the first 33 AAs of the polymerase. The modified T7 polymerase gene is stably retained in the nucleus and provides highly efective activation of the homologous promoter in the vector, leading to higher yields then known systems, e.g. 1 million cells can produce 20ug hGH/ml per 24 hr.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Claim 1;

Animal cells are first transfected with a recombinant (R1) contg. a viral gene stimulating vector replication under the control of a regulatable promoter. Clones with the greatest difference between induced and non-induced viral product are selected. The selected clones are than transfected with R2 and
peptide-macromolecule complex of the invention. The peptide-macromolecule complex of the invention is for delivering a macromolecule into a cell and comprises a non-exchangeable lipophilic peptide (LP) comprising a delivery peptide associated with a lipid moiety, where the delivery peptide portion of the LP is complexed to the macromolecule. The complexes can be used for the delivery of macromolecules such as nucle acids, proteins, oligonucleotides, lipids or carbohydrates. They can bused to treat diseases by enhancing delivery of specific nucleic acid the appropriate targeted cells. They can also be used to create transformed cells as well as transgenic animals for assessing human disease in an animal model. They can also be used for livestock
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                sequence, a selection gene, a prokaryotic promoter homologous to the RNA polymerase and (under the control of this promoter), a gene encoding foreign protein. Cells with the highest synthesis of foreign protein are selected and fermented with addition of an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     clones with nucleus-localised polymerase are selected. Finally, expression vector is introduced for production of a foreign protein. The construct comprises a viral replication start
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Delivery peptide; peptide-macromolecule complex; macromolecule delivery; non-exchangeable lipophilic peptide; disease therapy; cell targeting.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  30-MAR-1998

                                                                                                                                                                               The specification describes compositions for delivering compounds into cells. These compositions comprise an organic halide, a targeting ligand, and a nuclear localization sequence in combination with the compound to be delivered. The compositions are used to deliver compounds into cells, particularly for the treatment of autoimmune disorders and inflammatory conditions such as rheumatoid arthritis. They may also be used to deliver pharmaceuticals, drugs, diagnostic agents, synthetic organic molecules, peptides, proteins, vitamins, teroids, genetic materials and other bioactive agents. AhB30402-26 represent nuclear localisation sequences. They are used to enhance import of compounds into the nucleus, in compositions of the invention.
                                                                                                                                                                                                                                                                                                                    Compositions to deliver compounds into cells e.g. to treat rheumatoid arthritis, comprise organic halide, targeting ligand and nuclear localization sequence in combination with compound and carrier -

This invention describes a novel nuclear transport system (I) which CC comprises (i) a module (A) that binds specifically to DNA and can not form a complex with more than one DNA molecule; and (ii) a module (B) CC that includes a nuclear localization signal (NLS) or a non-NLS signal CC that does not bind non-specifically to DNA. (I) is used to deliver CC nucleic acid to cells, especially for gene therapy of cancer, viral CC infections, diseases of the nervous system, transplant rejection and CC mono- or poly-genic inherited disorders. (I) provide efficient transfer CC primary cells, so eliminate the need to induce cell division for transfer, but can also be used with established cell lines. (I) does not transport machinery, both features which improve transfer reficiency. It can be formulated as part of a virus-free gene transfer reficiency. It can be formulated as part of a virus-free gene transfer reficient that is casy and inexpensive to prepare and easier to manipulate than known viral complex with established of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match

                       CC the nucleus of eukaryotic cells, comprising applying an electrical pulse co field strength 2-10 kV/cm; duration at least 10 micro s and current at cleast 1 Amp. The transfected cells are used for diagnosis and for gene chargay, after ex vivo preparation. The method delivers DNA and/or other biological agents to the nucleus of cells of higher eukaryotes, comprisity. The time between transfection and analysis can be reduced to as little as 2 hours and pulse parameters are optimised for maximum conclear localisation. The high voltage gradient creates pores in both commissiones surrounding the nucleus but its short duration avoids conversible damage. The present sequence is that of a peptide nucleic concerning a nucleotide sequence (ABA97765) and a peptide corresponder of the target cell, provides a repressor for a reporter prasmit already present in the cells, binding to a sequence between the corresponder and the reporter gene cassette and inhibiting gene expression. CC PNA2 comprises a sequence specific for reporter gene repression, while corresponder and comprises a nonspecific sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Matches

CC A branched synthetic peptide conjugate is provided which can be CC designed to bind to a target cell surface receptor to penetrate into CC target cells and to deliver a diagnostic probe or cytotoxic CC functionality to a desired site of action.

CC The conjugate may be described as a series of peptide and chemical CC domains which may be separated by junctions. Each domain performs a CC particular cell targetting or a cellular function. Unctional segments CC are spacer regions that may in some cases allow the incorporation of CC chemically active moleties or markers. These domains and junctions are assembled on a branched polymer (BP) scaffold. The branching of the peptide is preferably provided by a polylysine construct having free CC alpha and epsilon amino groups to which linear series of domains and CC junctions can be attached. A preferred number of branches for the BP CC unit is 8, such structures being referred to as octopeptides.

CC The conjugate is a relatively small molecule of flexible design desired contains a branched structure for systematically incorporating a desired contains and structure for systematically incorporating a desired contains and structure for systematically incorporating a desired contains and cont
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New branched synthetic peptide conjugate - can be designed to bind to a tablet cell surface receptor or to deliver a diagnostic probe
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Disclosure; Page 12; 55pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This invention describes a novel system (I) for delivering a nucleic acid to a cell, comprising a binding complex comprising a ligand binding complex comprising a ligand binding complex comprising a ligand binding complex comprising a second binding complex comprising a conclear ligand. The complexes are simultaneously bound to the nucleic complex ligand. The in vivo targeting of the insertion of DNA into a cell. It can call to be used in processes for producing transformed cell lines. The comprising can be used to deliver a variety or proteins and polypeptides, complex comprising processes, concogenes, tumor antigens, tumor comprising comprising compressions, viral antigens, parasitic antigens, and bacterial antigens. The transporter system uses lysis agents to overcome the problems of conformal forcemental antigens considered antigens.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      RESULT 11
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match

The nucleic acid transporter system can also be used in a method for the in vivo targeting of the insertion of DNA into a cell. It can also be used in processes for producing transformed cell lines. The system can be used to deliver a variety or proteins and polypeptides, such as hormones, growth factors, enzymes, clotting factors, apolipoproteins, receptors, drugs, oncogenes, tumor antigens, tumor suppressors, viral antigens, parastitic antigens, and bacterial antigens. The transporter system uses lysis agents to overcome the problems of endosomal/lysosomal degradation seen with prior art systems.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This invention describes a novel system (I) for delivering a nucleic acid to a cell, comprising a binding complex comprising a ligand binding molecule noncovalently bound to a nucleic acid and covalently linked to a surface ligand, and a second binding complex comprising a second binding molecule noncovalently bound to a nucleic acid and covalently linked to a nuclear ligand. The complexes are simultaneously bound to the nucleic nuclear ligand.
        The present invention relates to isolated peptides comprising an amino acid sequence of a nuclear localization signal (NLS), thought to be cytostatic and virucidal in their action. The peptides are useful for screening anti-viral agents, as regulatory elements in gene therapy, and for other in vivo regulatory functions, as probes for diagnostic purposes and for research. The peptides are useful for treating viral infection or cancer. The present sequence is a peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence
                                                                                                                                                                                                  New isolated peptides, useful for screening anti-viral agents, as regulatory elements in gene therapy and other in vivo regulatory functions, as probes for diagnostic purposes and research, or for treating viral infection or cancer

                                                                                                                                                                                                                                                                             Ś
                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a nucleic acid transport system (NTS) for Cd delivering nucleic acid into a cell. The NTS contains but is not limited to 5 components: (a) the nucleic acid or a macromolecule to be delivered; (b) a moiety that recognizes and binds to a cell surface receptor or C antigen or is capable of entering a cell through cytosis; (c) a nucleic acid or macromolecular molecule binding moiety; (d) a moiety that is capable of moving or initiating movement through a nuclear membrane; and/ or (e) a lysis moiety that enables the transport of the entire complex from the cell surface directly into the cytoplasm of the cell. The NTS con the cell. The NTS can be used to treat disorders by targeting specific nucleic acid accordingly. The NTS can also be used to create transgenic animals for assessing human disease, such as cancer, in an animal model. The NTS can be used in vitro with tissue culture cells specific expression into specifically targeted tissue culture cells. The NTS avoids the problem of endosomal/lysosomal
                                                                                                                                                                                                                                                                                                        Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  transporter system. The nucleic acid transporter system uses nucleic acid binding complexes containing surface ligands which are capable of binding to a cell surface receptor and entering the cell through cytosis. The compounds of the invention are either ligands, binding molecules (surface ligands), lysis agents, spacer molecules or their intermediates. The ligands, binding molecules, lysis agents and spacer molecules are used in nucleic acid transporter systems to deliver nucleic acid into specific cells e.g. in gene therapy to deliver nucleic acid into hepatocytes, muscle cells or bone forming cells.

                                                                                                                                                                                                                                                                                                               The present invention relates to a transporter system for delivering nucleic acid to a cell. The system comprises a nucleic acid binding complex, consisting of a binding molecule bonded non-covalently to the nucleic acid, and covalently to a surface ligand, and a lytic agent. The binding molecule is spermine or a spermidine derivative. Nucleotide sequences AAA36633-A36652 and peptide sequences AAY99456-Y98500 are used in the construction of the transporter system of the invention. The transporter system is used in gene therapy, particularly to deliver nucleic acids to hepatocytes muscle cells or bone forming cells, e.g for treating cardiovascular disease, cancer, and infection. The transporter systems are also used to create transport animals (as models for human carcinogenesis or disease or for drug testing). Other uses include transforming cells to produce proteins, or transfecting cells in vitro to study the function of the nucleic acid. The use of a surface ligand allows specific targeting of selected cells and tissues. The lytic agent provides for release of the nucleic acid into the cellular
                                                                                                                                                                                              Query Match

                                                                                                                                                                                                                                                       Ş
                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a nucleic acid transport system (NTS) for CC delivering nucleic acid into a cell. The NTS contains but is not limited CC to 5 components: (a) the nucleic acid or a macromolecule to be delivered; (b) a moiety that recognizes and binds to a cell surface receptor or CC antigen or is capable of entering a cell through cytosis; (c) a nucleic acid or macromolecular molecule binding moiety; (d) a moiety that is CC capable of moving or initiating movement through a nuclear membrane; and/ CC or (e) a lysis moiety that enables the transport of the entire complex; CC from the cell surface directly into the cytoplasm of the cell. The NTS CC delivers nucleic acid into the cellular interior as well as the nucleus of specific nucleic acid accordingly. The NTS can also be used to create CC unimal model. The NTS can be used to treat disorders by targetting cC which allows the role of various nucleic acids to be studied by targeting specific expression into specifically targeted tissue culture cells. The CC derivation of the NTS avoids the problem of endosomal/lysosomal
                                                                                                                                                                                                                                                                                        Query Match

                                     The present invention relates to a method of transfecting cells using at least one protein capable of forming a nucleoprotein filament. The protein is first modified with at least one functional component that affects at least one stage of transfection, then the DNA to be transferred is loaded with the modified protein to form a thread-shaped complex and this is administered to the cells. Transfection agents such as this are useful in human or animal gene therapy, to identify activators and inhibitors of the expression products from the DNA, and to identify physiologically active nucleic acids. The present sequence is a peptide described in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Schmidt H, Altrogge L, Lenz
